6.002 Fall 2000

A Filter

$$V_c = \frac{Z_C}{Z_C + Z_R} \cdot V_i = \frac{1}{1 + j\omega RC}$$

Quick Review of Impedances-

Just as

$$I_{ab}$$
 R_{I}
 R_{I}
 R_{AB}
 $R_{AB} = \frac{V_{ab}}{I_{ab}} = R_{I} + R_{2}$
 R_{AB}

$$I_{ab}$$
 R_{I}
 R_{I}
 V_{ab}
 $V_{$

Quick Review of Impedances

Similarly

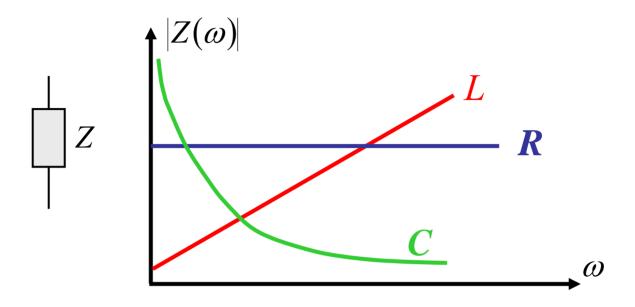

$$R_1 \overset{\wedge}{\Longrightarrow} A$$
 $C \overset{\wedge}{\Longrightarrow} R_2$
 $L \overset{\wedge}{\bowtie} R$

$$Z_{AB} = R_{I} + Z_{C} || R_{2} + Z_{L}$$

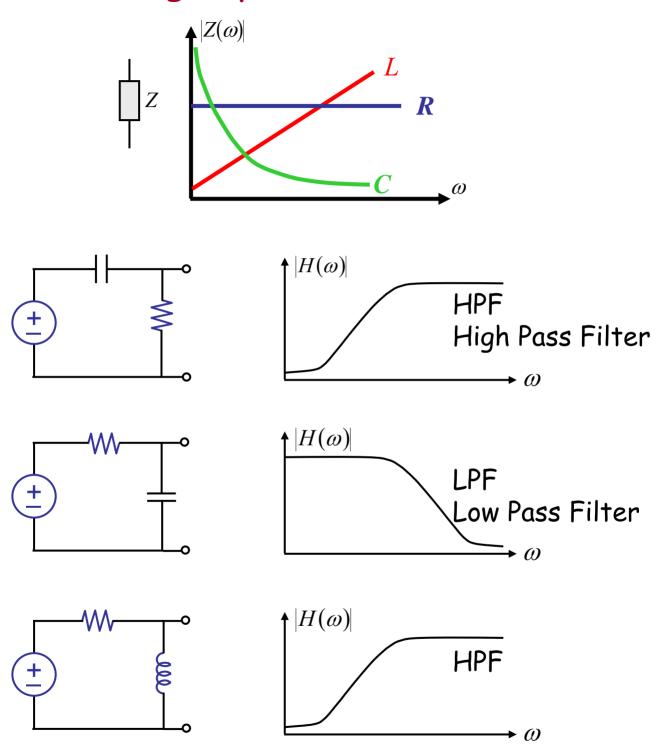

$$= R_{I} + \frac{Z_{C}R_{2}}{Z_{C} + R_{2}} + Z_{L}$$

$$= R_{I} + \frac{R_{2}}{1 + j\omega CR_{2}} + j\omega L$$

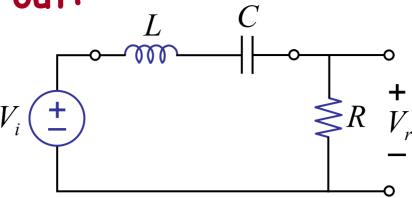

We can build other filters by combining impedances

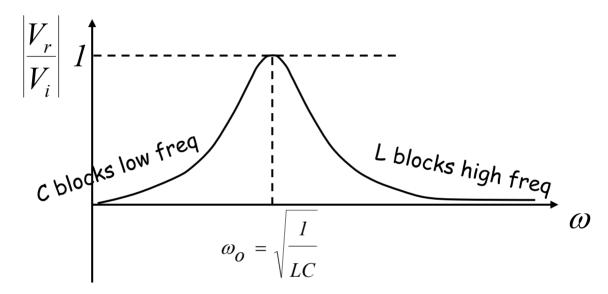

We can build other filters by combining impedances

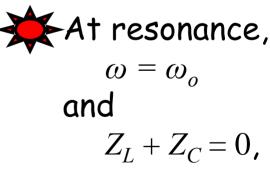

Intuitively:

$$\frac{V_r}{V_i} = \frac{R}{j\omega L + \frac{1}{j\omega C} + R}$$

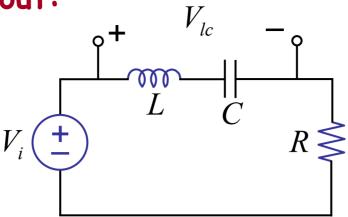

$$= \frac{j\omega RC}{1 - \omega^2 LC + j\omega RC}$$

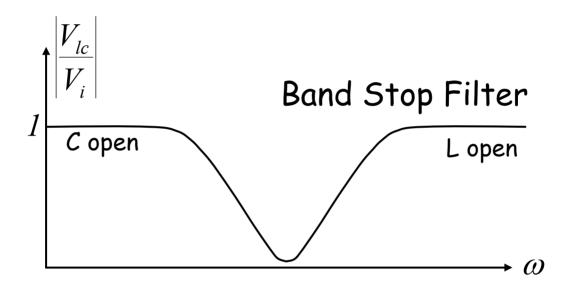

$$\left|\frac{V_r}{V_i}\right| = \frac{\omega RC}{\sqrt{(1 - \omega^2 LC)^2 + (\omega RC)^2}}$$

 $Z_L + Z_C = 0$ so V_i sees only R!More later...

What about:

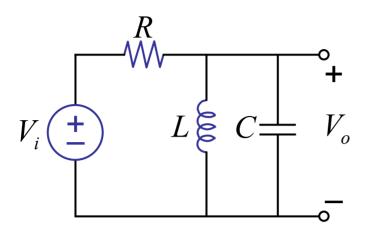

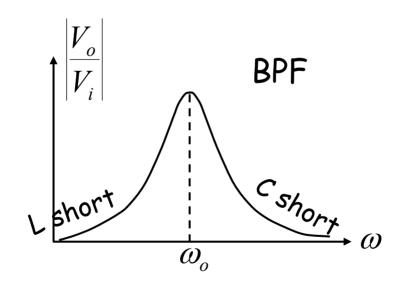

Check out V_l and V_c in the lab.

Lecture

AM Receiver

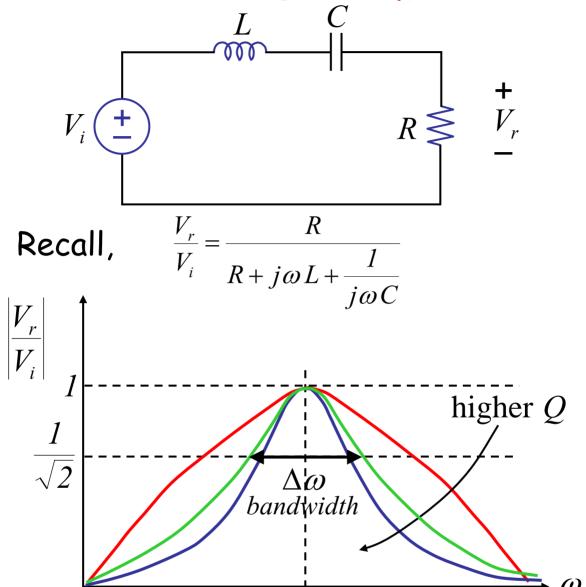

"Selectivity" important — relates to a parameter " \mathcal{Q} " for the filter. Next...

6.002 Fall 2000

Selectivity:

Look at series RLC in more detail

Define
$$Q = \frac{\omega_o}{\Delta \omega}$$
 quality factor

 $high Q \Rightarrow more selective$

 ω_{o}

Cite as: Anant Agarwal and Jeffrey Lang, course materials for 6.002 Circuits and Electronics, Spring 2007. MIT OpenCourseWare (http://ocw.mit.edu/), Massachusetts Institute of Technology. Downloaded on [DD Month YYYY].

6.002 Fall 2000

Lecture

$$Q = \frac{\omega_o}{\Delta \omega}$$

$$\omega_o$$
.

$$\frac{V_r}{V_i} = \frac{R}{R + j\omega L + \frac{1}{j\omega C}} = \frac{1}{1 + j\left(\omega \frac{L}{R} - \frac{1}{\omega CR}\right)}$$

$$\text{at } \omega_o = 0$$

$$\omega_o = \frac{1}{\sqrt{LC}}$$

 $\Delta\omega$?

$$Q = \frac{\omega_o}{\Delta \omega}$$

 $\Delta\omega$:

Note that abs magnitude is $\frac{1}{\sqrt{2}}$

when
$$\frac{V_r}{V_i} = \frac{1}{1+j\left(\omega\frac{L}{R} - \frac{1}{\omega CR}\right)} = \frac{1}{1\pm j1}$$
 i.e. when
$$\frac{\omega L}{R} - \frac{1}{\omega CR} = \pm 1$$

$$\omega^2 \mp \frac{\omega R}{L} - \frac{1}{LC} = 0$$

Looking at the roots of both equations,

$$\omega_{1} = \frac{R}{2L} + \frac{1}{2}\sqrt{\frac{R^{2}}{L^{2}} + \frac{4}{LC}} \qquad \qquad \omega_{2} = -\frac{R}{2L} + \frac{1}{2}\sqrt{\frac{R^{2}}{L^{2}} + \frac{4}{LC}}$$

$$\Delta\omega = \omega_1 - \omega_2 = \frac{R}{L}$$

$$Q = \frac{\omega_o}{\Delta \omega}$$

$$Q = \frac{\omega_o}{R} = \frac{\omega_o L}{R}$$

$$\omega_o = \frac{1}{\sqrt{LC}}$$

The lower the R (for series R), the sharper the peak

Another way of looking at Q:

$$Q = 2\pi \frac{\text{energy stored}}{\text{energy lost per cycle}}$$

$$= 2\pi \frac{\frac{1}{2}L|I_r|^2}{\frac{1}{2}|I_r|^2R\frac{2\pi}{\omega_0}}$$

$$Q = \frac{\omega_o L}{R}$$
